

Wilder Kaiser in Toronto

The customer decides to buy just the model Wilder Kaiser without a storage tank.
The doors of the model Wilder Kaiser are about four inches in front of the stove body which allows a stone, ceramic or tile cover.

After two winters experience we now received an email from our customer in Toronto.

The subject of his email:

Best decision ever

*So our Walltherm just got lit again for the start of its 3rd winter and we got thinking of you.....
Things are great.*

*After last years winter (a long and cold one) we can say that Walltherm reduced our wood consumption
from 8 bush cord a year to 5 bush cord a year.*

We are heating double the area now too !

(2800 sq.ft down and 2300 sq.ft up)

*As you know, I took a risk and didn't go with the water tanks and I can honestly say now that the thermal
mass properties of concrete to our basement floor turned out to be a perfect thermal battery for the
Walltherm unit, they really work well together.*

*It takes a full 4-6 hour burn to bring the floors up to heat and the concrete decrement releases heat a
perfect balanced rate....it takes all night for the floors to go cold once more and the whole house holds a
nice even temperature in the meantime when the fire is no longer burning.*

I'll typically burn each afternoon for 4-6 hours.

*It's awesome to have the ambience of a fireplace with the sensibility of hydronic transferred heat stored
into concrete. I'm your biggest advocate.*

We were very happy and proud getting this email.

It confirms that our products are as good as we tell our customers before they buy.
